RAG Architecture

Jay Dreyer

Solutions Engineer | RAG Architecture & LLM Integration | API
Governance & Developer Enablement | 25 Years Enterprise Tech
Minneapolis, Minnesota, United States

Summary

Enterprise AI projects don't fail because the technology doesn't work. They fail because nobody builds the bridge between what the system can do and what the business needs. I've been building that bridge for 25 years. For 25+ years across Gap Inc., Target, and consulting, I've lived in the space between engineering and product — evaluating enterprise technology, getting hands-on with implementation, and enabling thousands of employees to adopt it. I don't just manage roadmaps. I ship solutions. What that looks like in practice: Built a custom GPT that replaces a \$50K/year LinkedIn Talent Insights license — now used by 50+ recruiters - Scaled Gap's AI chatbot to a 75% employee inquiry resolution rate - Expanded Gap's documented API catalog from 30 to 225+ in a single year - Shipped two production web applications in one week using AI-assisted development (myrsdlist.com, tonepoettracker.com) - Led API governance and developer experience at Target for 10 years, building their API Developer Portal from the ground up Beyond the enterprise work, I've been building hands-on with AI systems at the architecture level. I designed and built recall.local — a privacy-first RAG system running entirely on local hardware, with dual memory architecture (Qdrant vector store for semantic retrieval + SQLite for structured state and audit trails), a multi-source ingestion pipeline, output validation with retry logic, and a nightly eval harness that tracks citation accuracy and latency regression across prompt and model changes. I run it on an Ubuntu server with an RTX 5060 Ti in my home office and use it daily. I also built LaunchLab — a full-stack healthcare agent launch simulator built on the Anthropic SDK, with three architecturally separate LLM subsystems: the agent under test, a patient simulator generating realistic synthetic conversations, and an LLM-as-Judge evaluator that scores agent readiness across 10 scenarios and produces a quantitative launch readiness report. I build with Codex, Claude Code, the Anthropic SDK, Qdrant, n8n, Next.js, FastAPI, and Python. The tools are secondary — what drives me is designing systems where the outputs are trustworthy,

auditable, and actually useful. I'm at my best when I'm connecting business problems to technical solutions, building proof-of-concepts, and helping organizations actually realize the value of the tools they're paying for. Open to Solutions Engineer roles at AI-first companies. Remote preferred. Let's talk: jaydreyer@gmail.com

Experience

LaunchLab (Independent)

AI Engineer - Independent Projects

March 2026 - Present (3 months)

Built LaunchLab, a full-stack healthcare agent launch simulator for configuring, stress-testing, and evaluating AI agents before pilot deployment — demonstrating the kind of pre-production validation thinking that matters in enterprise AI rollouts.

— Designed three architecturally separate LLM subsystems: a configurable healthcare scheduling agent, a patient simulator generating realistic synthetic conversations across selectable scenarios, and an LLM-as-Judge evaluator that scores completed conversations against defined criteria

— Implemented dynamic prompt assembly at runtime from practice and agent configuration (locations, providers, hours, insurance, escalation rules, guardrails) — the agent's behavior changes immediately as configuration changes, with no hardcoded prompts

— Built a 10-scenario Eval Runner that runs automated patient-vs-agent conversations, scores outputs across 4–5 sub-criteria per scenario, and produces a launch readiness dashboard with pass/fail breakdowns, failure theme analysis, and deployment constraints

— Full stack: React 18, FastAPI, SQLite, Anthropic SDK (Claude Sonnet), Zustand, shadcn/ui. Public GitHub repo available.

myrsdlist.com — Record Store Day Catalog App

Creator & Developer

January 2026 - Present (5 months)

Shipped a production web app in under a week using AI-assisted development (Claude Code). Searchable catalog of 364+ Record Store Day releases with

genre/format/label filtering, prioritized wishlist with mobile Line Mode, and geo-enabled store locator.

Built a two-tier data enrichment pipeline (Discogs API → OpenAI fallback) to classify every release by genre — solving a real data quality gap where the official RSD catalog provides no genre data.

Stack: Next.js 15, Supabase, Vercel, Discogs API, OpenAI API, Claude Code

Recall.local

Builder & Architect

October 2025 - Present (8 months)

Plymouth, MN

Designing and building a privacy-first RAG system with dual memory architecture (Qdrant vector store for semantic retrieval + SQLite for structured state and audit trails), running entirely on local hardware with a cloud LLM escape hatch for model swapping.

Key technical work:

- Multi-source ingestion pipeline (file watch, URL extraction, email forwarding, mobile share sheet) converging on a unified webhook
- Heading-aware chunking with metadata tagging for scoped retrieval across multiple use cases
- Output validation and retry logic for reliable structured JSON from local LLMs
- Evaluation harness tracking citation accuracy and latency regression across prompt and model changes

Stack: Ollama, Qdrant, n8n, Open WebUI, SQLite, Python, Trafilatura

Gap Inc.

3 years 10 months

Product Manager II - Employee Enablement & AI

April 2023 - Present (3 years 2 months)

Led AI enablement and enterprise SaaS strategy for Gap's workforce, bridging technical implementation with business adoption across the organization.

AI & Automation:

- Built a custom GPT for recruiting that replaces LinkedIn Talent Insights (\$50K/year) — now adopted by 50+ recruiters across the organization

- Managed and optimized Gap's internal AI chatbot (Aisera), improving the employee inquiry resolution rate to over 75% through data-driven analysis of usage patterns
- Authored Gap's company-wide guide for writing AI-optimized content, establishing standards for how teams structure documentation and knowledge base articles to improve AI readability and response accuracy — now adopted across the organization
- Recognized as a ChatGPT Champion; trained product managers and cross-functional teams on practical AI adoption and custom GPT development
- Used Claude Code to analyze Aisera chatbot usage data, identifying improvement opportunities that informed product decisions
- Managed enterprise SaaS tools (Miro, Airtable, Smartsheet) enabling thousands of employees in product development and design workflows
- Oversaw Gap's intranet platform, collaborating with external vendors on implementation, updates, and content strategy

Product Manager II - API Platform & Governance

August 2022 - April 2023 (9 months)

Served on the API Platform team, leading API governance and driving adoption of design standards across engineering.

- Increased documented API catalog from 30 to 225+ in one year by partnering with development teams on OpenAPI specifications
- Led API design specification reviews ensuring alignment with Gap's enterprise standards
- Consulted with engineering teams early in the design phase, using feedback metrics to streamline the onboarding process

Target

16 years 5 months

Lead Engineer - API Platform & Developer Experience

January 2016 - August 2022 (6 years 8 months)

Greater Minneapolis-St. Paul Area

Built and managed Target's API Developer Portal and served as the company's primary technical resource for API design, governance, and third-party developer enablement.

- Developed and maintained Target's API Developer Portal, the central hub for internal and external API consumers
- Enforced REST API standards through OpenAPI/Swagger specification reviews across engineering teams

- Implemented OpenAPI/Swagger tooling to accelerate API design and construction for development teams
- Built relationships with and provided technical support to external third-party developers
- Managed the developer portal roadmap and supported Target-sponsored Hackathons

Senior Business Analyst & API Evangelist

April 2006 - January 2016 (9 years 10 months)

Served as Target's API Evangelist, driving adoption of API-first practices across the organization and supporting the growth of Target's API ecosystem.

- Championed API adoption through monthly communications, organizational presentations, and direct developer engagement
- Maintained the API Developer Portal and managed intake requests for new and enhanced APIs
- Collaborated with Finance to deliver quarterly NPV calculations to leadership, connecting technical investment to business outcomes

Compuware

Consultant

August 1999 - March 2006 (6 years 8 months)

Built enterprise web applications using .NET for automotive and financial services clients. Performed technical and business analysis.

Electronic Data Systems

Systems Engineer

1995 - 1999 (4 years)

Developed internal applications for General Motors using Visual Basic. Worked on IVR systems and enterprise tooling.

Education

University of Michigan - Stephen M. Ross School of Business

MBA, Information Technology · (2001 - 2005)

University of Michigan

BA, History · (September 1991 - April 1995)
